Because the EPA Extraction Procedure as defined in the May 19, 1980 edition of the Federal Register is not applicable to samples of an organic nature or those not filterable under the conditions of the test, the sample itself was analyzed for the EP Toxicity inorganic parameters. These results are presented for limited comparison purposes only. The results are expressed in micrograms of constituent per gram of sample.

II. Analytical Results

The parameters analyzed and results are delineated in the following tables. The interlaboratory variability of the parameters analyzed in the type of sample matrix submitted has not been established by EPA, and is probably at lengt ± 20%. S-R is currently evaluating the variability of all tests performed for NJDEP in different types of matrices. ATIGA-SAMPLE taken from

- On April 10, 1980, I inspected the Scientific Chemical Processing facility at 216 Paterson Plank Road, Carlstadt. I met with Mr. Max Barnes and he accompanied me during the inspection tour. During the inspection, I observed the following:
  - 1. The entire left side of the facility has crushed stone spread on the ground. Ponding of surface water has been greatly reduced. Only a few puddles were present during this inspection:
  - 2. The depression around the tank farm contained several inches of water, probably due to recent rains. All the tanks were standing in the water. At the time of inspection this standing water was being pumped to the sewer connection. This discharge is metered for volume, but not monitored for any contaminates. Mr. Barnes stated that the sewer authority spot checks the discharge. Mr. Barnes stated that the materials contained in tanks has not changed. He stated that sampling and testing is underway in Newark to establish the exact identity of the material. Mr. Barnes stated the materials to be mostly heavy paint sludges containing large amounts of solids.

I also observed that a spill had occurred before I arrived and I saw several men shoveling contaminated soil and a red liquid into a 55 gallon drum. I also noted that a quantity of this liquid had spilled into the water within the depression of the tank farm. It was previously noted that this same water was being pumped to discharge to the sewer connection. I asked Mr. Barnes if he planned on shutting off the pump to prevent the discharge of this contaminated water. He stated he would do so, but he failed to have it shut off before I left approximately 50 minutes later. Mr. Barne identified the red liquid as product that has already been processed and is to be sold as a fuel. The material emitted a solvent/type odor in the immediate area of the spill.

- 3. I observed that all of the rusted and deteriorating drums containing waste materials have been removed. Mr. Barnes stated that all the drums have been taken to the Newark facility. He stated they were concentrating on getting Carlstadt cleaned up.
- 4. At this time I observed the still to be operating and the second processing unit, the thin film evaporator not to be operating. Mr. Barnes stated that they continue to process a methanol, water, and phosphoric acid waste stream with the still, while the thin film had not operated for several days. Mr. Barnes stated the thin film operates only 1-2 days per week. The thin film area had been cleaned within the diked area. As well, a dike had been constructed at the rear of the area. The drum platform had also been cleaned. There were approximately 40 drums of what Mr. Barnes represented as product on the pad.

5. I again observed a scepage from the creek bank into the Peach Island Creek. The seepage appears to be an oily type liquid producing a multicolored sheen on the surface of the water.

# SCP, Carlstadt - Findings

On May 19, 1979 an inspection of the Scientific Chemical Processing facility was conducted. This facility is located on Paterson-Plank Road, Carlstadt, New Jersey. Mr. Mac Barnes accompanied me during the inspection. Mr. Herb Case met us after the inspection tour to answer any questons. The following observations were made. See the sketch for corresponding physical locations.

- 1. This is the tank farm area. The tank farm is one-two feet below surface elevation. The containment area is not lined. Liquids are free to seep into the ground in this area. Eighteen tanks are located here. Mr. Barnes said all contained waste materials of various types, except for three which are empty. He said all materials stored in the remaining fifteen tanks are old waste materials without manifest, except of tanks 112 and 119 which are new waste for which there are manifest. I observed a brownish-red liquid within the tank farm area along one side of the contained area. Photograph #1 shows this liquid.
- 2. This area is where a distillation unit and boiler house are located. Trailers parked in this area are used as feeds and receivers for materials run through the still. The still has a small dike around the apparatus. The trailers have no secondary containment. Much of the stone covering the ground in this area, as well as the area inside the diked area is pink in color, possibly indicating a past spill. A liquid can be seen seeping from the creek bank directly behind the boiler house. Photograph #2 shows this seepage.
- 3. This is a staging platform holding empty and full drums containing waste materials. The platform contained about 100 empty drums, and about 160 full drums. Manifest #58358 was observed on about 60 drums. Although the platform slants inward to prevent run-off the sides of this platform are completely stained with materials that have run down the walls of this platform. Two trailers at the rear of the platform contain old leakers pulled from the yard. One trailer has drums with manifest #89107 marked on them. The three trailers at the front of the platform contain sludges generated from the distillation processes on site.
- 4. The thin film evaporator and adjacent tank farm are all diked. Various colored liquids could be seen in the thin tilm diked area. No leakage was seen in the tank farm area. Photographs #3 and #4 show the general area. The thin film area is messy and poorly maintained. Housekeeping is poor. Drums, tools and pieces of scrape are scattered about the general area.
- 5. This is a drum storage area directly in front of the thin film unit. There are approximately 1500-2000 drums stored on the ground in this area. Mr. Barnes said this material was on-site prior to May 1, 1978 and had no manifest. He said these drums had been recently moved to this area to segregate materials. Red and black liquids were observed in several areas of this storage area. Photograph #5 shows one of these spill areas. These drums are stored directly on the ground, with no containment present. The drums are stacked poorly, creating the possibility of drums falling and spilling their contents onto the ground. Many of the drums are rusted and in poor condition. A sludge box is located in this area to empty drums.

6. This is the second major drum storage area, located adjacent to the tank farm. Approximately 1300 drums are stored here. Like the first storage area, all drums are stored directly on the ground without proper containment. Many of these drums are rusted and in poor condition, leaking their contents onto the ground in the area. Various colored liquids including black and yellow, can be seen in numerous areas of this drum storage area. These drums are also old drums without manifest according to Mr. Barnes.

# NEW JERSEY STATE DEPARTMENT OF ENVIRONMENTAL PROTECTION

10	Bob Reed through Tony Altieri T.A.	
FROM	Rich Cahayla-Wynne and Mox Tan MT	DATE January 22, 1979
SUBJECT_	Scientific Chemical Processing - Carlstadt, Inspection and Chain of Custody Sampling of	NJ - Hazardous Waste Spill January 19, 1979

On January 19, 1979, we were informed of a possible hazardous waste spill at the Scientific Chemical Processing plant at 216 Paterson Plank Road, Carlstadt.

At about 1000 hours we arrived at the location of the plant, but were unable to enter because the property is completely surrounded by a fence and there was no one in sight to let us in. After walking around the plant perimeter and noting two permitted cooling water discharges into Peach Island Creek, we called Bob Reed who contacted the firm at 411 Wilson Ave., Newark, (201) 589-7777. SCP sent Herbert Case, who escorted us through the plant at 1130 hours.

According to Mr. Case, on the night of the 18th, the Tz was an unreported spill of unknown quantity somewhere within their plant premises. Mr. Case was not able to provide details as to location, composition or time of spill. He said that the employee who did not report the spill as required by company rules was terminated, but will be questioned for more details.

The spill apparently took place within the diked area underneath one of the thin film evaporators used to distill solvents from themical wastes. The cooling water from the thin film evaporator is discharged to a pipe with an opening at ground level within the diked area. Two employees from SCP were manually removing what apparently was spilled sludge material. We collected Sample #C49947 of this sludge at 1215 hours from the floor of the diked area near the opening to the cooling water discharge pipe. The sample was reddish brown, viscous and had an extremely strong chemical odor.

The cooling water discharge pipe runs underground for about 100 feet and reappears from the river bank about 300 feet east of Gotham Parkway. Mr. Case did now whether this discharge was DIS 001 or DIS 002 of permit #NJ 0003212. We sampled the effluent at 1155 (Sample #C49946). The sample was clear and had no detectable odor.

Floating on the surface of the creek near the outfall pipe was accumulated sludge similar in appearance to the material spilled within the diked area. We sampled the surface water containing some of this sludge at 1205 hours, (Sample # C49945). The sample had a distinct chemical odor similar to that of the spilled material within the diked area.

Approximately 50 feet east of the discharge pipe was a large amount of reddish brown sludge on the surface of the ice. We sampled this at 1230 hours, (Sample # C49948). This sludge appeared identical to the sludge floating near the outfall pipe and to the sludge within the diked area. The sample was viscous and had the same extremely strong chemical odor.

We left the SCP area at 1235 hours and returned to the office. All of the above samples were collected using a chain of custody which was transferred to Tom Harrington at 1430 hours. Mr. Harrington transported the samples to the lab at that time.

FORM APPROVED OMB NO. 49-R 0 18

# DEPARTMENT OF THE ARMY, CORPS OF ENGINEERS

APPLICATION FOR PERMIT TO DISCHARGE OR WORK	IN NAVIGABLE WATERS AND THEIR TRIBUTARIES  2 S D OXW 2 000762
SECTION I. GENERAL INFORMATION	1. State Application Number (to be assigned by Corps of Engineers) 2 S 0 0 N 2 Q00762 Div. Dist. Type Sequence No.
2. Name of applicant and title of signing official Scientific	Chemical Processing. Inc.
	mond, President
3. Mailing address of applicant Scientific Chemical 216 Paterson Plank Carlstadt, New Jers	Road
4. Name, address, telephone number and title of applicant's authorized ag	
Leif R. Sigmond, B	resident I Processing, Inc.
216 Paterson Plank	
Carlstadt, Now Jer 201 939-0467	
Before attempting to complete this form.  Required Information  a. All information contained in this application will, upon request, be entitled "Confidential Answers" must be used to set out information mercial or financial information of a confidential nature. The information-fidential treatment can be considered only for that information for vattached sheet. However, in no event will identification of the conteinformation.  b. The applicant shall furnish such supplementary information as is requested. If additional space is needed for a complete response to any item on that sheet the item numbers to which answers apply.  d. Drawings required by items 20 and 21 should be attached to this applicable, copies of a water quality certification or a written com of Section II below), the additional information sheet(s) in "c" above fees  If any discharge or deposit is involved, an application fee of \$100 minutes and point of discharge or deposit.  Signature  a. If a discharge is involved, an application submitted by a corporation an official of the rank of corporate vice president or above who reposits.	made available to the public for inspection and copying. A separate sheet in which is considered by the applicant to constitute trade secrets or compation must clearly indicate the item number to which it applies. Considered by the request of confidentiality has been made on the rits and frequency of a discharge be recognized as confidential or privileged uired by the District Engineer in order to evaluate fully an application, this form, attach a sheet entitled "Additional Information." Indicate on oblication. Other papers which must be attached to this application include, munication which describes water quality impact (see Item 22 and Item 10 re, and the confidential information sheet described in "a" above.  The submitted with this application. An additional \$50 is required for each imust be signed by the principal executive officer and who has been designated if of the corporation, in the case of a partnership or a sole proprietorship,
the application must be signed by a general partner or the proprietor b. If no discharge is involved, an application may be signed by the application of the proprietor b.	. Other signature requirements are discussed in the pamphlet.
to the best of my knowledge 18 U.S.C. # Firm, execs indicted in chemical dumping

# By STUARTMARQUES

A North Jersey chemical processing firm and three of its officers were indicated yesterday on charges of damping more than 100,000 gallons of dangerous chemical wastes into Newark's sewer system.

In a 34-count indictment, a state grand jury said Scientific Chemical Processing Inc.-of Carlstadt and Newark, dumped acid, cyanide, flammable liquid and other dangerous wastes into Newark sewers in 1977-and-1978. Some of the wastes included known or suspected cancer-causing agents.

Authorities said about 5,000 gallors of cyanide waste were dumped into a trench 30 feet from an acid tank farm. If the acid had seeped into the cyanide, officials said, deadly cyanide gas would have formed.

Officials said some of the illegally

dumped wastes were so flammable they could have ignited in the presence of a spark at temperatures of 54 or 64 degrees. A chemical is considered flammable if it can be ignited below 200 degrees.

Edwin Stier, director of the state Division of Criminal Justice, identified the indicted officers as Leif Sigmond, 53, of Oceanport, Herbert Case, 35, of Dunellen and black Barnes, 38, of Bloomfield

Sigmond is the president of Scientific Chemical, Case is the account executive and Barnes is operations manager.

They could not be reached for comment. A receptionist at the firm's Newark office said they were unavailable.

The indictment said the company and its officers conspired between June 1977 and July of last year to dump chemical wastes without permits, illegally dump the wastes into Newark's sewer

system and "habitually" violated the law.

Authorities said former Scientific employe Carmine Trezza Jr. is cooperating with authorities, as are several other past or present workers.

The company and each of the indicted officers were charged with one count of conspiracy, 16 counts of unlawful water pollution, 16 counts of creating a public nuisance and one count of using a building for an unlawful purpose.

Stier said the ongoing probe began last spring when two Newark policemen noted activity at the firm's Newark head-quarters.

The building was placed under surveillance and a July 13, 1978, raid was ordered. The raiding party saw a Scien-

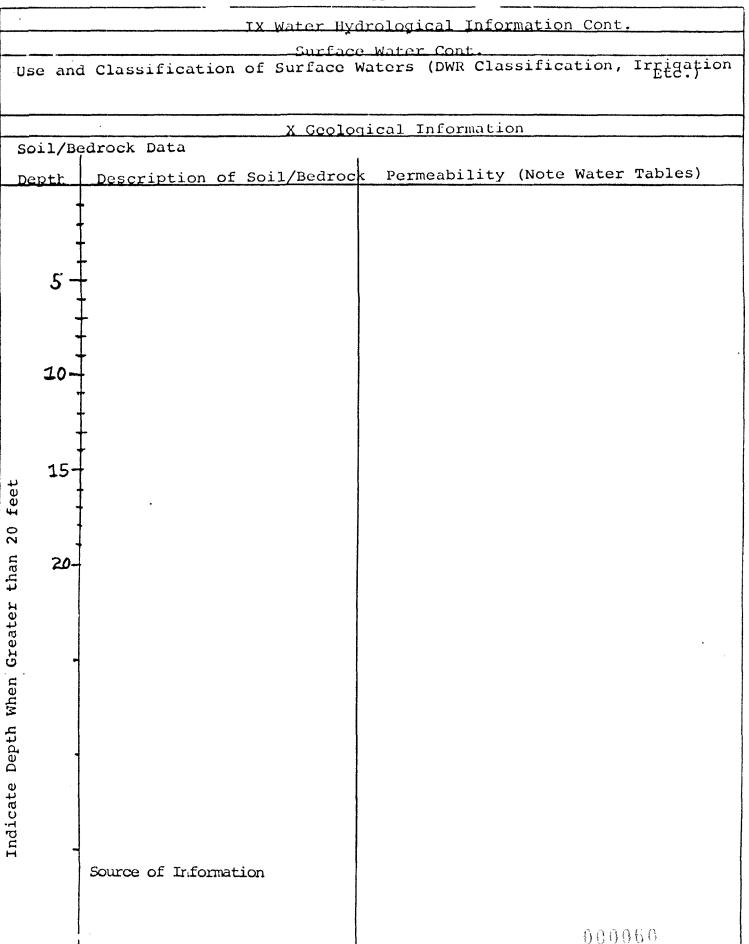

tific Chemical tanker truck dumping 5,000 gallons of untreated chemical wastes "directly into the sewer system," Stier said.

Assistant Attorney General Robert Winter said the firm dumped some of the wastes into trenches that led to city sewers operated by the Passaic Valley Sewerage Commission.

The indictment said the firm sometimes used metal or rubber pipes to dispose of the wastes from the plant to the sewer system.

A spokesman for Attorney General John Degnan said the illegally dumped wastes included 15.629 gallons of acid, 10,000 gallons of flammable solvents, 1.500 gallons of flammable liquids and 5,000 gallons of cyanide.

# Scientific Chemical Processing, Inc.

411 WILSON AVE NEWARK NEW JERSEY 07105 PHONE 201 589 7777

June 27, 1980

Dr. Ralph Pasceri Chief, Bureau of Hazardous Waste 32 E. Hanover St. Trenton, N.J. 08625

Dear Dr. Pascer1:

We are enclosing an inventory for our Caristadt Plant as of June 25, 1980.

In order to remove products and make plans to proceed in an orderly manner to reduce inventories we suggest the following stepwise approach:

# Step T

Ship out recovered products.

- 1. Return 2500 gallons recovered methanol from W-12 tank to Harmon Colors, Haledon, N.J.
- 2. Ship 6500 gallons of recovered thinner from the thin film receiver and VPC-11 tank.
- 3. Return 41 X 55 gallon drums of recovered thinner to Custom Chemical, Elmwood Park, N.J.
- 4. Send 3000 gallons of recovered phosphoric acid from VTS-1 tank to Plant Food Products, Cranbury, N.J.
- 5. Return 3000 gallons in tank VTS-131 of crude methanol/phosphorie acid mixture to Harmon Color, or as an alternative separate the ingredients and return as in above 1 & 4. This is a one day operation and of course would be done under your monitoring.

Note: We would appreciate implementing the above action as quickly as possible to avoid evaporation of the solvents and to remove correstive material from the individual storage vessels.

6. Use up 500 gallons of diesel fuel from VT-56 in the tracking operation.
